Resonium (Polystyrene sulfonate resin)

Newborn use only

| Alert | Insulin-glucose and salbutamol (albuterol) infusions are more effective and safer options for treatment of | | |
|---------------------------------------|--|--|--|
| | hyperkalaemia.(1) | | |
| | Not for oral administration in neonates. | | |
| | Effective lowering of serum potassium with Resonium may take hours. The efficiency of potassium | | |
| | exchange is unpredictable and variable. | | |
| | Available as sodium or calcium resins | | |
| | Common international brand name for sodium polystyrene sulfonate is Kayexalate. | | |
| Indication | Hyperkalaemia (serum potassium greater than 6.5 mmol/L)(1) | | |
| Action | Removes potassium from body by exchanging it within the gut for sodium/calcium. | | |
| | In vivo, 1 gram of resin exchanges about 1 mmol of potassium.(2) | | |
| Drug type | Cation exchange resin. | | |
| Trade name | Resonium A Powder for suspension (Sodium polystyrene sulfonate) | | |
| | Calcium Resonium Powder for suspension (Calcium polystyrene sulfonate) | | |
| Presentation | Resonium A powder for suspension – Sodium content is 4.1 mmol/g of Resonium A.(2) | | |
| | Calcium Resonium powder for suspension – Calcium content is 1.6-2.4 mmol/g of Resonium.(2) | | |
| Dose | Dose: 1 g/kg every 4-6 hours, followed by colonic irrigation 8-12 hours after the last resin dose (see | | |
| | Administration section)(3, 4) | | |
| | Recommended resin: | | |
| | Resonium A: if plasma sodium is normal or if plasma calcium is high. | | |
| | Calcium Resonium: if plasma sodium is high, | | |
| | Duration of therapy: Cease once serum potassium returns to normal (<6 mmol/L) | | |
| Dose adjustment | No specific information. | | |
| Maximum dose | | | |
| Total cumulative | | | |
| dose | | | |
| Route | Rectal | | |
| Preparation | Dilute each gram/kg of Resonium with 3-5mL/kg of Water for Injection or glucose 10%. | | |
| Administration | PR only, should not be administered orally. | | |
| | Aim to retain dose rectally for as long as possible, at least 30 minutes. | | |
| | Evacuation of resin: Evacuate Resonium 8-12 hours later with glycerine enema or 1 to 2 mL of sodium | | |
| | chloride 0.9%. | | |
| Monitoring | Serum electrolytes: potassium, sodium, calcium (hypercalcaemia) and magnesium (hypomagnesaemia). | | |
| Ū | Cardiorespiratory and apnoea monitoring. | | |
| Contraindications | Resonium A and Calcium Resonium should not be administered orally to neonates | | |
| | Neonates with reduced gut motility (e.g. post-operatively or drug induced).(2) | | |
| | History of hypersensitivity to polystyrene sulfonate resins. | | |
| | Serum potassium levels less than 5 mmol/L. | | |
| | Obstructive bowel disease. | | |
| Precautions | Hypercalcaemia, hyperparathyroidism: Avoid calcium resin. | | |
| | Congestive heart failure, hypernatraemia, sodium overload: Avoid sodium resin. | | |
| Drug interactions | Not applicable. | | |
| Adverse | Hypokalaemia, hypernatraemia, hypocalcaemia, hypercalcaemia, hypomagnesaemia. | | |
| reactions | Water overload | | |
| | Gastrointestinal: Perforation, haemorrhage, necrotising enterocolitis. | | |
| Compatibility | Not applicable | | |
| Incompatibility | Not applicable | | |
| Stability | Suspensions of the resin should be freshly prepared and not stored beyond 24 hours. | | |
| · · · · · · · · · · · · · · · · · · · | Once reconstituted, Resonium A and Calcium Resonium is a cream to light brown coloured suspension in | | |
| | which small white particulates may remain visible. | | |
| Storage | Store below 30°C. | | |
| Excipients | Resonium A and Calcium Resonium: Saccharin sodium and vanillin. | | |
| -Acipiento | Resonant A and Calcium Resonant. Sacchaint Soulant and Valimin. | | |

Newborn use only

| Special | Mild laxatives may be used to treat or prevent constipation; do not use sorbitol – a hyperosmotic laxative |
|-----------------|---|
| comments | (risk of colonic necrosis) or magnesium-containing laxatives; stop treatment if significant constipation |
| | occurs. |
| | Excessive dosage or inadequate dilution could result in impaction of resin, particularly in early infancy. |
| Evidence | Efficacy |
| | No firm recommendations can be made on resonium for the treatment of hyperkalemia because of |
| | limited information from small studies of uncertain quality,(LOE I; GOR B).(1) Two small randomised trials |
| | identified in Cochrane review suggested that the combination of insulin and glucose is preferred over |
| | treatment with rectal cation-resin for hyperkalaemia in preterm infants.(1) RCT by Malone et al enrolled |
| | 12 preterm infants ≤ 28 weeks GA. Sodium polystyrene sulfonate (Kayexalate) was prepared in 25% |
| | sorbitol and administered rectally 1 g/kg every 6 hours in 5 infants and glucose-insulin infusion was |
| | administered in 7 infants. All 5 infants treated with Kayexalate had an increase in serum K ⁺ concentration |
| | of more than 0.5 mmol/L within the first 6 hours of treatment, and treatment was considered to have |
| | failed. Hu et. al., enrolled 40 VLBW infants with non-oliguric hyperkalaemia and randomly divided them |
| | into insulin (RI) infusion group and Kayexalate group. In Kayexalate group (n=20), the dose of Kayexalate |
| | was 1g/kg given rectally every 4 hours. The duration of hyperkalaemia in RI group was significantly shorter in comparison to Kayexalate group. The incidence of grade II and above intraventricular |
| | haemorrhage (IVH) was significantly low in RI group (15% vs 50%). Sample sizes of the trials in this meta- |
| | analysis were very small to make any firm recommendations in clinical practice, but insulin and glucose |
| | infusion and albuterol infusion were found to be safer and more effective in comparison to cation |
| | exchange resin. (1, 3-5) |
| | Safety |
| | Gastrointestinal haemorrhage and intestinal perforation and necrosis have been reported. (6-10) Sorbitol |
| | used for Resonium enema preparation have been implicated for these complications. Incidence of ≥ |
| | grade 2 intraventricular haemorrhage was higher in Kayexalate group in comparison to glucose-insulin |
| | treated infants. (3) |
| | Pharmacokinetics |
| D | Polystyrene sulfonate is not absorbed from the gastrointestinal tract.(2) |
| Practice points | There are safer and more effective interventions including insulin-glucose infusion and salbutamol |
| | (albuterol) infusion to treat hyperkalaemia. (1) Resonium preparation in sorbitol enemas are hypertonic and associated with intestinal complications |
| | including necrosis and perforation. (6-9) |
| | To reduce the likelihood of intestinal complications, evacuation of rectal Resonium by irrigation with |
| | either glycerine or 1 to 2 mL of 0.9% sodium chloride can be performed. (10, 11) |
| | In children and neonates particular care should be observed with rectal administration, as excessive |
| | dosage or inadequate dilution could result in impaction of the resin. |
| | Due to the risk of GI haemorrhage, colonic necrosis or sodium overload, particular care should be |
| | observed in preterm infants or low birth weight infants. |
