

<b>Alert</b>	In Australia, it is available as sodium acetate 16.4% (2 mmol/mL of acetate). It has an osmolality of 4000 mOsm/L. Concentrated sodium acetate ampoules <b>MUST BE DILUTED</b> prior to use.(1) Calculated osmolality of sodium acetate – half strength, standard strength and high strength in this formulary are 160 mOsm/L, 320 mOsm/L and 1000 mOsm/L respectively. These osmolalities are similar to sodium chloride 0.45%, 0.9% and 3% respectively.(2, 3) (Refer to special comments section).
<b>Indication</b>	1. Metabolic acidosis: Prevention and treatment 2. Hyponatraemia: An alternative source of correction in the presence of acidosis. 3. Maintenance of arterial line patency
<b>Action</b>	Acetate is an alkalinising agent and can be used to increase plasma bicarbonate concentration and correct metabolic acidosis. (4) Acetate is metabolised in the liver to bicarbonate.
<b>Drug type</b>	Electrolyte
<b>Trade name</b>	DBL Sodium acetate concentrated injection
<b>Presentation</b>	Sodium acetate concentrated injection 10 mL glass ampoule: Contains 1.64 gram/10 mL sodium acetate. This is equivalent to sodium acetate 16.4%.(1) Each 1 mL contains 2 mmol acetate and 2 mmol sodium.
<b>Dose</b>	<b>Intravenous correction for metabolic acidosis</b> 1-3 mmol/kg/day. Dose beyond 3 mmol/kg/day may be used at the discretion of treating team.  <b>Arterial line patency for infants ≤ 1.5 Kg#</b> As a routine intra-arterial line infusion (prevention of metabolic acidosis) (ANMF consensus) < 1 Kg: sodium acetate half strength* with heparin 1 unit/mL at 0.5 mL/hour. 1-1.5 Kg: sodium acetate standard strength* with heparin 1 unit/mL at 0.5 mL/hour.  *Half strength and standard strengths are similar in osmolality to sodium chloride 0.45% and 0.9% respectively.  #There may be clinical situations where <b>standard strength</b> sodium acetate is used in arterial line infusion to correct metabolic acidosis in infants >1.5 Kg.
<b>Dose adjustment</b>	No information.
<b>Maximum dose</b>	No information.
<b>Total cumulative dose</b>	No information.
<b>Route</b>	Intravenous, intra-arterial.
<b>Preparation</b>	<b>Intravenous correction for metabolic acidosis</b> <b>Sodium acetate – Standard strength*</b> Add 4 mL of sodium acetate (8 mmol) to 46 mL of water for injection to make a final volume of 50 mL with a concentration of 0.16 mmol/mL. 1 mmol/kg/day = 0.26 ml/kg/hour  <b>Sodium acetate – High strength* (central line preferred)</b> Add 12.5 mL of sodium acetate (25 mmol) to 37.5 mL of water for injection to make a final volume of 50 mL with a concentration of 0.5 mmol/mL (25 mmol/ 50 ml). 1 mmol/kg/day = 0.08 ml/kg/hour  *standard and high strengths are similar in osmolality to sodium chloride 0.9% and 3% respectively.  <b>Arterial line patency (heparin added) for infants ≤ 1.5 Kg</b> <b>Sodium acetate – Half strength* (for weight &lt; 1 Kg):</b> Draw up 2 mL of sodium acetate (equivalent to 4 mmol of acetate), add 5 mL of Heparinised Saline (50 units), and add to 43 mL of water for injection to make a final volume of 50 mL with a concentration of 0.08 mmol/mL of sodium acetate.

# Sodium acetate

## Newborn use only

2023

	<p><b>Sodium acetate – Standard strength* (for weight 1-1.5 kg):</b>            Draw up 4 mL of sodium acetate (equivalent to 8 mmol of acetate), add 5 mL of Heparinised Saline (50 units), and add to 41 mL of water for injection to make a final volume of 50 mL with a concentration of 0.16 mmol/mL of sodium acetate.</p> <p>*Half strength and standard strengths are similar in osmolarity to sodium chloride 0.45% and 0.9% respectively.</p> <p>Sodium and acetate provided in mmol/kg/day with the above <b>intra-arterial</b> line infusion:</p> <table border="1"> <thead> <tr> <th>Weight</th> <th>Sodium acetate strength</th> <th>Rate</th> <th>mmol/kg/day</th> </tr> </thead> <tbody> <tr> <td>500 g</td> <td rowspan="3">Half strength</td> <td rowspan="3">0.5 mL/hour</td> <td>1.9 mmol/kg/day</td> </tr> <tr> <td>750 g</td> <td>1.2 mmol/kg/day</td> </tr> <tr> <td>1000 g</td> <td>0.9 mmol/kg/day</td> </tr> <tr> <td>500 g</td> <td rowspan="4">Standard strength</td> <td rowspan="4">0.5 mL/hour</td> <td>3.8 mmol/kg/day</td> </tr> <tr> <td>750 g</td> <td>2.5 mmol/kg/day</td> </tr> <tr> <td>1000 g</td> <td>1.9 mmol/kg/day</td> </tr> <tr> <td>2000 g</td> <td>0.95 mmol/kg/day</td> </tr> </tbody> </table>	Weight	Sodium acetate strength	Rate	mmol/kg/day	500 g	Half strength	0.5 mL/hour	1.9 mmol/kg/day	750 g	1.2 mmol/kg/day	1000 g	0.9 mmol/kg/day	500 g	Standard strength	0.5 mL/hour	3.8 mmol/kg/day	750 g	2.5 mmol/kg/day	1000 g	1.9 mmol/kg/day	2000 g	0.95 mmol/kg/day

<b>Administration</b>	Continuous infusion																						
<b>Monitoring</b>	Electrolytes, acid base status (bicarbonate, base excess, pCO <sub>2</sub> )																						
<b>Contraindications</b>	Hypernatraemia Fluid overload																						
<b>Precautions</b>	Renal impairment																						
<b>Drug interactions</b>																							
<b>Adverse reactions</b>	Metabolic alkalosis Hypernatraemia Fluid overload Aluminium toxicity from leaching of aluminium from glass ampoules.(5)																						
<b>Compatibility</b>	Fluids: Glucose 5%, sodium chloride 0.9%, Amino acid solutions, lipid emulsion (6) Y site: aciclovir, alfentanil, allopurinol, amifostine, amikacin, aminophylline, ampicillin, anidulafungin, asparaginase, atenolol, atracurium, azithromycin, aztreonam, buprenorphine, busulfan, calcium folinate, calcium gluconate, capreomycin, cefazolin, cefepime, cefotaxime, ceftazidime, ceftriaxone, cefuroxime, clindamycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, ephedrine, adrenaline (epinephrine), erythromycin lactobionate, esmolol, fentanyl, fluconazole, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gentamicin, heparin, hydrocortisone, imipenem-cilastin, labetalol, levofloxacin, lidocaine (lignocaine), linezolid, lorazepam, magnesium sulfate, methadone, methotrexate, methylprednisolone, metronidazole, milrinone, morphine, naloxone, netilmicin, nitroprusside sodium, octreotide, ondansetron, pamidronate, pancuronium, pentobarbital, phenobarbital (phenobarbitone), phenylephrine, piperacillin-tazobactam, potassium chloride, propranolol, ranitidine, remifentanyl, rocuronium, sodium bicarbonate, suxamethonium, sulfamethoxazole-trimethoprim, tacrolimus, theophylline, ticarcillin, tobramycin, vancomycin, vasopressin, vecuronium, verapamil, voriconazole, zidovudine																						
<b>Incompatibility</b>	Fluids: No information. Y site: Amiodarone, amphotericin B conventional colloidal and lipid complex, caspofungin, diazepam, hydralazine, mycophenolate mofetil, pantoprazole, phenytoin																						
<b>Stability</b>																							
<b>Storage</b>	Store below 30°C. Single use only. Replace syringe every 24 hours.																						
<b>Excipients</b>	Water for injection																						
<b>Special comments</b>	<table border="1"> <thead> <tr> <th>Solution</th> <th>Electrolyte (mmol/mL)</th> <th>Osmolarity (mOsm/L)</th> </tr> </thead> <tbody> <tr> <td>Human Plasma</td> <td></td> <td>280-300</td> </tr> <tr> <td>Sodium acetate 16.4%</td> <td>2 mmol/mL of Na</td> <td>4000</td> </tr> </tbody> </table>	Solution	Electrolyte (mmol/mL)	Osmolarity (mOsm/L)	Human Plasma		280-300	Sodium acetate 16.4%	2 mmol/mL of Na	4000													
Solution	Electrolyte (mmol/mL)	Osmolarity (mOsm/L)																					
Human Plasma		280-300																					
Sodium acetate 16.4%	2 mmol/mL of Na	4000																					

	Sodium chloride 0.45%	0.08 mmol/mL of Na	154
	Sodium chloride 0.9%	0.15 mmol/mL of Na	308
	Sodium chloride 3%	0.51 mmol/mL of Na	1027
	Sodium acetate half strength	0.08 mmol/mL of Na and acetate	160

	Sodium acetate high strength	0.5 mmol/mL of Na and acetate	1000
	Sodium bicarbonate 8.4%	1 mmol/mL of Na and bicarbonate	2000
	Sodium bicarbonate 4.2%	0.5 mmol/mL of Na and bicarbonate	1000

<b>Evidence</b>	<p><b>Background</b> Sodium acetate is similar to bicarbonate in its ability to restore blood pH and plasma bicarbonate.(7) It can also be used as the source of sodium in parenteral nutrition solution in preterm neonates.</p> <p><b>Efficacy</b> In a prospective study by Ekblad et al, 11 infants <math>\leq</math> 34 weeks were supplemented with sodium acetate added to the daily intravenous fluids from day 1 of life. Sodium acetate was used as the sole source of sodium on day 1 of life and both sodium chloride and sodium acetate were used in equal amounts as the source of sodium from day 2 of life. Actual intakes of sodium acetate on day 1 and thereafter were 3 mmol/kg/day and 1.5 mmol/kg/day respectively. They demonstrated an improvement in metabolic acidosis (less number of infants with pH &lt; 7.3) without any worsening in PCO<sub>2</sub>. Serum sodium was normal in all infants.(8) In a double blind randomised controlled trial, Ali et al compared the parenteral nutrition (PN) solutions containing sodium acetate or sodium chloride on biochemical parameters and clinical outcomes in 52 infants &lt; 33 weeks including 29 extremely low birth weight infants &lt;1000 g. PN was prepared based on 2005 ESPGHAN guidelines. The intervention arm received sodium acetate as the entire source of sodium whereas the control arm received sodium chloride as the source of sodium. In the first 6 days of life, intervention arm received mean intake of sodium (and acetate) 4 mmol/kg/day. Blood pH and base excess rose to normal values after 3 days of PN in the acetate group. There was no significant difference in pCO<sub>2</sub> between groups. There was a significantly lower incidence of bronchopulmonary dysplasia in the acetate group. There was also a trend towards lower incidence of severe intraventricular haemorrhage.(7)</p> <p><b>Pharmacokinetics</b> Following administration acetate is metabolised in liver to bicarbonate.</p>
