Atropine Newborn use only

| Alert | | | |
|----------------------|--|--|--|
| Indication | Prevention of reflex bradycardia during elective endotracheal intubation. Preanaesthetic medication to prevent perioperative adverse events. | | |
| Action | Competitively inhibits acetylcholine at muscarinic acetylcholine receptors, decreases the effects of the parasympathetic nervous system and increases the effects of the sympathetic nervous system. Increases heart rate with a peak effect in 2–4 minutes after IV administration. Salivary secretion and intestinal and gastric motor activity are decreased for up to 6 hours. Bronchial smooth muscle relaxes, decreasing airways resistance. | | |
| Drug Type | Anticholinergic | | |
| Trade Name | Atropine sulphate | | |
| Presentation | Vial for injection – 600 microgram/1 mL ampoule. | | |
| Dosage | Intubation IV, IM: 10 microgram/kg/dose (range 10–20 microgram/kg/dose) | | |
| | Preanaesthetic medication PO: 20 microgram/kg/dose 1 hour prior to induction of anaesthesia (range 20–40 microgram/kg/dose). | | |
| Route | PO, IV, IM | | |
| Preparation | IV, IM or PO: Draw up 0.5 mL (300 microgram of atropine) and add 5.5 mL sodium chloride 0.9% to make a final volume of 6 mL with a concentration of 50 microgram/mL. | | |
| Administration | IV slow bolus Administer orally with or without feeds Can be repeated after 5 minutes if required. | | |
| Monitoring | Continuous cardiorespiratory monitoring. Monitor temperature and abdominal distension. | | |
| Contraindications | Hypersensitivity to atropine. Arrhythmias, tachycardia, congenital glaucoma, intestinal obstruction, obstructive uropathy, asthma. | | |
| Precautions | Fever — in febrile patients or patients exposed to elevated ambient temperature, there is risk of provoking hyperpyrexia and heat prostration Gastro-oesophageal reflux | | |
| Drug Interactions | | | |
| Adverse Reactions | Tachycardia, arrhythmia, hyperthermia, flushing, irritability, abdominal distension, oesophageal reflux with decreased oesophageal sphincter tone, decreased gut motility, urinary retention, dry mouth. | | |
| Compatibility | Fluids: sodium chloride 0.9% Y-site: Adrenaline (epinephrine), amikacin, aminophylline, amiodarone, calcium chloride, calcium gluconate, cefazolin, cefotaxime, ceftazidime, cefuroxime, ceftriaxone, chlorothiazide, clindamycin, dexamethasone, digoxin, dopamine, dobutamine, erythromycin, famotidine, fentanyl, fluconazole, folic acid, furosemide (frusemide), gentamicin, glycopyrronium bromide (glycopyrrolate), heparin, hydrocortisone sodium succinate, imipenem, indometacin, insulin, lidocaine (lignocaine), magnesium sulfate heptahydrate, meropenem, methadone, metoclopramide hydrochloride, morphine sulfate pentahydrate, midazolam, nafcillin, naloxone, noradrenaline (norepinephrine), benzylpenicillin, | | |
