Poractant alfa

Newborn use only

Alert	This medication should only be administered by a medical officer or nurse practitioner.	
Indication	Treatment and prophylaxis of respiratory distress syndrome (RDS).	
	Treatment of meconium aspiration syndrome (MAS).	
Action	Lowers surface tension on alveolar surfaces during respiration and stabilises the alveoli against collapse at	
	resting trans pulmonary pressures.	
Drug type	Pulmonary surfactant	
Trade name	Curosurf	
Presentation	Suspension for intra-tracheal use 120mg/1.5mL or 240mg/3mL vials	
Dose	Respiratory distress syndrome	
	Loading dose of 200mg/kg	
	Repeat dose of 100mg/kg when required every 6–12 hours.	
	Maximum of 3 doses.	
	Meconium aspiration syndrome	
	Single dose: 200mg/kg	
	Further doses can be given as below if required: 2 nd dose: 200mg/kg	
	3 rd dose: 100mg/kg	
	4 th dose: 100mg/kg	
	These doses can be administered at 6 hour interval.	
Dose adjustment	Therapeutic hypothermia – Not applicable.	
	ECMO – Not applicable	
	Renal impairment – No dose adjustment.	
	Hepatic impairment – No dose adjustment.	
Maximum dose		
Total cumulative dose		
Route	Intra-tracheal	
Preparation	Not applicable	
Administration	This medication should only be administered by a medical officer or nurse practitioner.	
Administration	This medication should any be duministered by a medical officer of harse practitioner.	
	Inspect product visually for discolouration prior to administration (suspension should be white to creamy	
1	white). Before use, the vial should be slowly warmed to room temperature (can be warmed in hand or	
1	white). Before use, the vial should be slowly warned to room temperature (can be warned in hand of

Poractant alfa

Newborn use only

Monitoring	Continuous oxygen saturation and cardiorespiratory monitoring.	
Contraindications	None known	
Precautions	Correction of acidosis, hypotension, anaemia, hypoglycaemia and hypothermia is recommended by the manufacturer prior to poractant alfa administration but this is not always possible in practice.	
Drug interactions	Not applicable	
Adverse	Transient: Bradycardia, hypotension, endotracheal tube blockage and oxygen desaturation. These events	
reactions	require stopping poractant alfa administration and taking appropriate measures to alleviate the condition. After the patient is stable, dosing may proceed with appropriate monitoring. Ventilator settings may need	
0	to be adjusted post-surfactant to accommodate increased lung compliance.	
Compatibility	Should not be mixed with any other medications or fluids.	
Incompatibility	Not applicable	
Stability	Vials are for single use only. DO NOT SHAKE. Unopened, unused vials that have warmed to room temperature can be returned to refrigerated storage within 24 hours for future use. Document on the packaging the date and time the product was removed from the fridge. Notify Pharmacy Department/NICU Pharmacist if this occurs. Do not warm to room temperature and return to refrigerated storage more than once.	
Storage	Store at 2–8°C. Protect from light.	
Excipients		
Special	Surfactant may alter amplitude-integrated electroencephalography (aEEG) recordings after administration.	
comments		
Evidence	Early versus delayed surfactant treatment	
	Early selective surfactant administration given to infants with RDS requiring assisted ventilation leads to a	
	decreased risk of acute pulmonary injury (decreased risk of pneumothorax and pulmonary interstitial	
	emphysema) and a decreased risk of neonatal mortality and chronic lung disease compared to delaying	
	treatment of such infants until they develop worsening RDS ^{4, 5} (LOE I, A).	
	Prophylaxis versus rescue treatment	
	There does not appear to be additional benefit from prophylactic surfactant compared to nasal CPAP and	
	early rescue surfactant ^{4, 6} (LOE I, GOR B).	
	early rescue surfactant ^(*) (LOE I, GOR B).	
	Method of administration	
	Post-ventilatory surfactant (after resuscitation) reduces mortality and chronic lung disease 36-40 weeks ⁷	
	(LOE II, GOR B).	
	Nasal continuous positive airway pressure (nCPAP) with rescue thin catheter surfactant versus nCPAP with rescue intubation and surfactant reduces the risk of intubation and pneumothorax and reduces the incidence of chronic lung disease ⁸⁻¹² (LOE I, GOR B).	
	Nasal CPAP with rescue thin catheter surfactant is better tolerated than nCPAP with rescue intubation and surfactant and immediate extubation (InSurE) with no difference in other clinical outcomes ¹⁰⁻¹² (LOE I, GOR B).	
	Dose	
	Higher first dose poractant (200 mg/kg compared to 100 mg/kg) reduces need for re-dosing without	
	proven clinical benefit ^{13,14} (LOE 1, GOR B). Higher dose poractant 200 mg/kg compared to lower dose	
	beractant 100 mg/kg reduces mortality and need for re-dosing ¹⁵⁻¹⁷ (LOE 1, GOR B).	
	Multiple doses of surfactant (up to 4) given to infants with ongoing respiratory insufficiency leads to	
	improved clinical outcomes ¹⁸ (LOE 1, GOR A).	
	Meconium aspiration syndrome: Surfactant replacement therapy for meconium aspiration syndrome	
	reduces the incidence of respiratory failure ¹⁹ (LOE 1, GOR B). Trials used surfactant 100–200 mg/kg every 6	
	hours up to a maximum 4 doses. Trials reported response from earlier (before 6 hours) and frequent	
	surfactant replacement (every 6 hours for 3–4 doses) ^{20, 21} .
